

PRAYOG INDIA — Frontend Specification

Project: Prayog India | Next.js Web + Flutter Android/iOS + Admin Panel + Store/Walk-in POS +
Inventory & Business Management

Prepared from the Prayog India functional & technical scope PDF.

1. Design Principles

Premium, clean, professional UI with strong hierarchy, consistent spacing, restrained motion, accessibility and responsive behavior. Admin is information-dense; customer checkout is simple; POS is tablet-first; mobile customer experience is mobile-first.

2. Customer Web

Header: logo, search, categories/shop, account, wishlist and cart. Homepage: promotional/hero area, featured/trending/deals/new arrivals/recommendations, services, learning and notification slider.

PLP: product image, name, SKU, specifications, MRP, selling price, discount, GST, stock, rating, wishlist, quick view and add-to-cart/buy-now; sorting and filters.

PDP: gallery, title, SKU, brand, price, GST, stock, variants, actions, description, features, applications, specifications, what's included, datasheet/manual, related products, frequently bought together, recommended accessories and reviews.

Checkout: address → customer pricing/coupon → rewards → shipping validation → shipping method → payment → confirmation → invoice/tracking.

3. Admin Panel

Primary navigation: Dashboard, Products, Categories, Brands, Inventory, Purchases, Suppliers, Orders, Customers, Walk-in, Sales Documents, Shipping, Coupons & Offers, Rewards, Learning Hub, Services, CMS, Support, WhatsApp, Notifications, Sales Executives, Incentives, Reports, Analytics, Stores, Users & Roles, Settings.

Dashboard should expose KPI cards, trends, filters and actionable alerts for low/out-of-stock products, pending payments/shipments/returns and store performance.

Tables should support search, filter, sort, pagination, bulk actions, export and clear loading/empty/error states.

4. POS / Store UI

Tablet-first layout: persistent store/user/device/session context; fast product/SKU search; catalogue grid; stock visibility; cart; customer details; B2B toggle; coupons/rewards; payment; invoice actions.

Payment UI must support Cash, UPI, Card, Bank Transfer and Split Payment. Split Payment should show running paid amount, remaining amount and each payment component.

POS must prevent actions outside the authorized store/device scope.

5. Mobile App

Bottom navigation: Home | Categories | Search | Cart | Account. Include OTP/Google login, search/filtering, product details, wishlist, checkout, payments, orders, tracking, reviews, notifications, support, offers, profile, addresses, invoices and rewards.

Mobile-specific: product sharing, WhatsApp sharing, native image optimization, offline caching, recently viewed products, persistent cart and app-update notifications.

6. UX States & Accessibility

Every async screen needs loading, empty, error, retry and success feedback. Forms require inline validation and clear server-error handling.

Use keyboard-accessible controls, visible focus states, adequate contrast, semantic labels and touch targets appropriate for tablet/mobile POS.

7. Frontend Architecture

Next.js customer/admin apps should use reusable UI primitives, domain-based components, typed API clients, centralized auth/session handling and consistent data-fetching patterns.

Keep business rules on the backend. Frontend can calculate presentation values, but authoritative price, tax, discount, stock, payment and permissions come from backend APIs.
